

NO_x emitters in Europe 2016

WHAT IS NO_x (NITROGEN OXIDE)?

NO_x is a collective term for gaseous oxides of nitrogen. NO_x is largely generated during combustion processes. NO_x pollution is therefore higher in urban areas than in the countryside. Although, for example in Germany, the NO_x emissions were already reduced by just under 70% between 1990 and 2015, it is considered necessary to reduce this even further using the technology already available to manufacturers.
